

ABSTRACT

5 A nail clipper for pets has a scissors structure provided with cutting surfaces formed  
by curved blade pieces. The curved blade pieces are created by dividing a spherical or elliptical body  
into quarter pieces having a hollow interior and formed with curved cutting edges. The blade pieces  
are hinged to opposite ends of a holding piece and moved by pivoting parts coupled to the ends of  
operating parts of the scissors structure. By operating the scissors structure, the curved blade pieces  
open and come together to cut the pet's nail, producing smooth nail edges cut in a curved shape with  
10 a single cutting action.
